

Participation— goals and process evaluation at individual and societal levels

KB Hagen, E Bautz.Holter, RW Aas, I Harsløf , PK Solvang, N Vøllestad, J. Hagfors, C Røe

Themes and topics discussed

- Participation - work an important component
- Goal planning or goal setting an essential part of rehabilitation practice. (*"If goals are reached, life is meaningful"*)
- The present organization of rehabilitation services is often fragmented, and is considered as a major challenge to the quality of services (*"The Coordination reform"*).
- Musculoskeletal- and rheumatic diseases.

Preliminary aim

- To focus on the goal setting processes across groups of users with different painful musculoskeletal conditions, levels and types of services, and life areas.

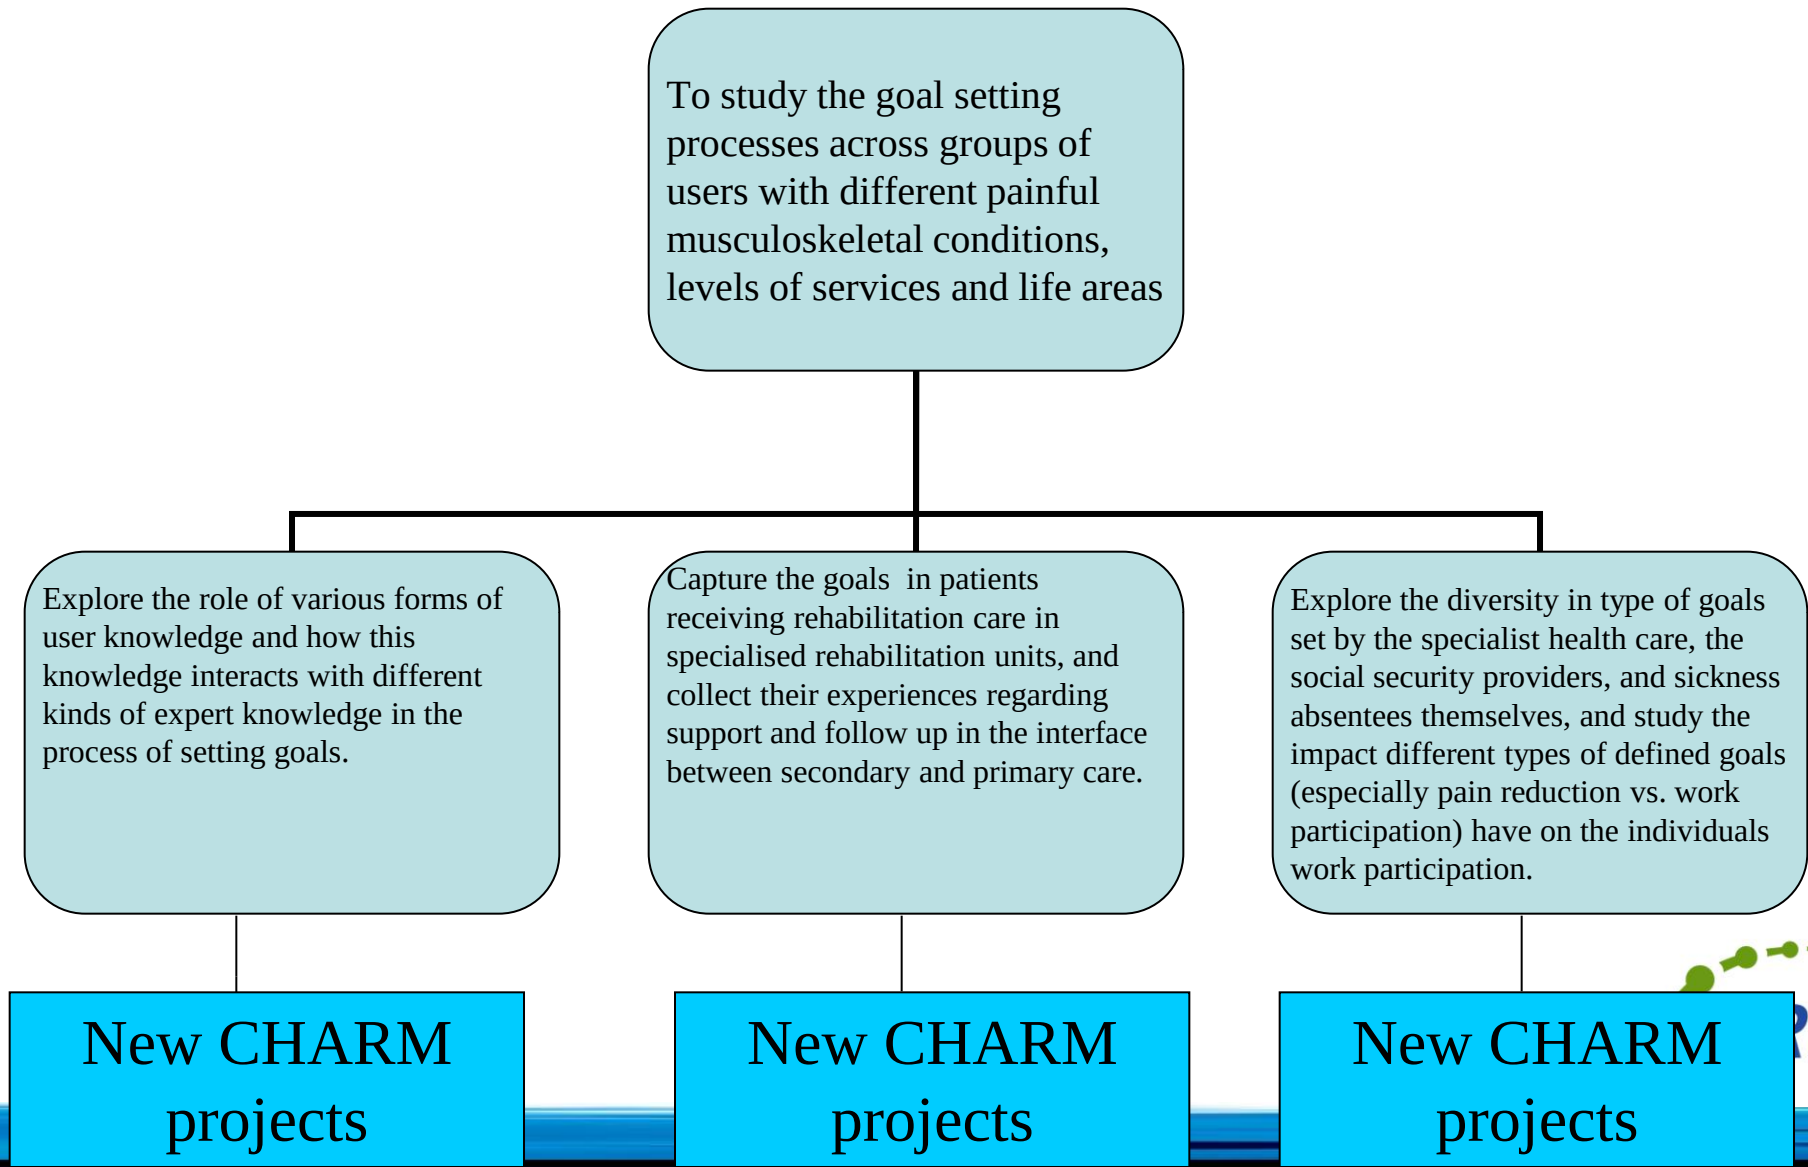

We need advice from the board!!

- Possible reserach questions
- Organization of the project within CHARM

Suggested research questions

- explore the role of various forms of user knowledge and how this knowledge interacts with different kinds of expert knowledge in the process of setting goals.
- capture the goals in patients receiving rehabilitation care in specialised rehabilitation units, and collect their experiences regarding support and follow up in the interface between secondary and primary care.
- explore the diversity in type of goals set by the specialist health care, the social security providers, and sickness absentees themselves, and study the impact different types of defined goals (especially pain reduction vs. work participation) have on the individuals work participation.
